

# Comprehensive Report

## Acunetix Threat Level 2

One or more medium-severity type vulnerabilities have been discovered by the scanner. You should investigate each of these vulnerabilities to ensure they will not escalate to more severe problems.

### Scan Detail

|                       |  |
|-----------------------|--|
| Target                | <a href="http://usbangla-bijoytech.ssbmultiservices.com">usbangla-bijoytech.ssbmultiservices.com</a> |
| Scan Type             | Full Scan  |
| Start Time            | Feb 8, 2024, 6:25:11 PM GMT+8  |
| Scan Duration         | 1 hour, 9 minutes  |
| Requests              | 186605   |
| Average Response Time | 32ms   |
| Maximum Response Time | 29231ms  |
| Application Build     | v23.7.230728157  |

# Application error messages

---

This alert requires manual confirmation

Acunetix found one or more error/warning messages. Application error or warning messages may expose sensitive information about an application's internal workings to an attacker.

These messages may also contain the location of the file that produced an unhandled exception. Consult the 'Attack details' section for more information about the affected page(s).

## Impact

---

Error messages may disclose sensitive information which can be used to escalate attacks.

# Laravel debug mode enabled

---

The web application uses Laravel framework. Laravel Debug mode is enabled. Debug mode should be turned off in production environment, as it leads to disclosure of sensitive information about the web application.

## Impact

---

The web application in debug mode discloses sensitive information. This information can be used to launch further attacks.

#### [Error Handling](#)

<https://laravel.com/docs/7.x/errors#configuration>

# Clickjacking: X-Frame-Options header

---

Clickjacking (User Interface redress attack, UI redress attack, UI redressing) is a malicious technique of tricking a Web user into clicking on something different from what the user perceives they are clicking on, thus potentially revealing confidential information or taking control of their computer while clicking on seemingly innocuous web pages.

The server did not return an **X-Frame-Options** header with the value DENY or SAMEORIGIN, which means that this website could be at risk of a clickjacking attack. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page inside a frame or iframe. Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into untrusted sites.

## Impact

---

The impact depends on the affected web application.

## Cookies without HttpOnly flag set

One or more cookies don't have the HttpOnly flag set. When a cookie is set with the HttpOnly flag, it instructs the browser that the cookie can only be accessed by the server and not by client-side scripts. This is an important security protection for session cookies.

### Impact

Cookies can be accessed by client-side scripts.

## Recommendation

If possible, you should set the HttpOnly flag for these cookies.

# Cookies without Secure flag set

One or more cookies does not have the Secure flag set. When a cookie is set with the Secure flag, it instructs the browser that the cookie can only be accessed over secure SSL/TLS channels. This is an important security protection for session cookies.

## Impact

Cookies could be sent over unencrypted channels.

<https://usbangla-bijoytech.ssbumultiservices.com/> Verified

## Recommendation

---

If possible, you should set the Secure flag for these cookies.

# HTTP Strict Transport Security (HSTS) not implemented

---

HTTP Strict Transport Security (HSTS) tells a browser that a web site is only accessible using HTTPS. It was detected that your web application doesn't implement HTTP Strict Transport Security (HSTS) as the Strict Transport Security header is missing from the response.

## Impact

---

HSTS can be used to prevent and/or mitigate some types of man-in-the-middle (MitM) attacks

## Recommendation

---

It's recommended to implement HTTP Strict Transport Security (HSTS) into your web application. Consult web references for more information

## References

---

### [hstspreload.org](https://www.hstspreload.org)

<https://www.hstspreload.org/>

# Insecure Inline Frame (iframe)

---

The web page was found to be using an Inline Frame ("iframe") to embed a resource, such as a different web page. The Inline Frame is either configured insecurely, or not as securely as expected. This vulnerability alert is based on the origin of the embedded resource and the iframe's sandbox attribute, which can be used to apply security restrictions as well as exceptions to these restrictions.

## Impact

---

When a web page uses an insecurely configured iframe to embed another web page, the latter may manipulate the former, and trick its visitors into performing unwanted actions.

## <https://usbangla-bijoytech.ssbumultiservices.com/contact>

Verified

An iframe tag references an external resource, and no sandbox attribute is set.

# Content Security Policy (CSP) not implemented

---

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.

Content Security Policy (CSP) can be implemented by adding a **Content-Security-Policy** header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:

```
Content-Security-Policy:  
default-src 'self';  
script-src 'self' https://code.jquery.com;
```

It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.

## Impact

---

CSP can be used to prevent and/or mitigate attacks that involve content/code injection, such as cross-site scripting/XSS attacks, attacks that require embedding a malicious resource, attacks that involve

malicious use of iframes, such as clickjacking attacks, and others.

Connection: Keep-alive
```

## Recommendation

---

It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the **Content-Security-Policy** HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.

## References

# Email addresses

---

One or more email addresses have been found on this website. The majority of spam comes from email addresses harvested off the internet. The spam-bots (also known as email harvesters and email extractors) are programs that scour the internet looking for email addresses on any website they come across. Spambot programs look for strings like myname@mydomain.com and then record any addresses found.

## Impact

---

Email addresses posted on Web sites may attract spam.

# HTTP Strict Transport Security (HSTS) not following best practices

---

HTTP Strict Transport Security (HSTS) instructs a web browser to only connect to a web site using HTTPS. It was detected that your web application's HTTP Strict Transport Security (HSTS) implementation is not as strict as is typically advisable.

## Impact

---

HSTS can be used to prevent and/or mitigate some types of man-in-the-middle (MitM) attacks

### <https://usbangla-bijoytech.ssbbmultiservices.com/>

URLs where HSTS configuration is not according to best practices:

# Subresource Integrity (SRI) not implemented

---

Subresource Integrity (SRI) is a security feature that enables browsers to verify that third-party resources they fetch (for example, from a CDN) are delivered without unexpected manipulation. It works by allowing developers to provide a cryptographic hash that a fetched file must match.

Third-party resources (such as scripts and stylesheets) can be manipulated. An attacker that has access or has hacked the hosting CDN can manipulate or replace the files. SRI allows developers to specify a base64-encoded cryptographic hash of the resource to be loaded. The integrity attribute containing the hash is then added to the <script> HTML element tag. The integrity string consists of a base64-encoded hash, followed by a prefix that depends on the hash algorithm. This prefix can either be sha256, sha384 or sha512.

The script loaded from the external URL specified in the Details section doesn't implement Subresource Integrity (SRI). It's recommended to implement Subresource Integrity (SRI) for all the scripts loaded from external hosts.

## Impact

---

An attacker that has access or has hacked the hosting CDN can manipulate or replace the files.

## Recommendation

---

Use the SRI Hash Generator link (from the References section) to generate a <script> element that implements Subresource Integrity (SRI).

For example, you can use the following <script> element to tell a browser that before executing the https://example.com/example-framework.js script, the browser must first compare the script to the expected hash, and verify that there's a match.

```
<script src="https://example.com/example-framework.js"
integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HNQlGYl1kPzQholwx4JwY8wC"
crossorigin="anonymous"></script>
```
